Abstract

Disclosed is a modular fluorescence sensor having the following general formula:

$$\begin{array}{c} \text{F1--(CH_2)_n-N} < \overset{(\text{CH}_2)_m-\text{Bd}_1}{\text{Sp}_{\searrow}} \\ \text{N---(CH_2)_x-An} \\ | \\ (\text{CH}_2)_y-\text{Bd}_2 \end{array}$$

Where FI is a fluorophore, N is a nitrogen atom, B_{d1} and B_{d2} are independently 10 selected binding groups, Sp is an aliphatic spacer, and An is an anchor group for attaching the sensor to solid substrates. n = 1 or 2, m = 1 or 2, x is an integer, and y = 11 or 2. The binding groups are capable of binding an analyte molecule to form a stable 1:1 complex. In a preferred embodiment, the Bd1 is R1-B(OH)2 and Bd2 is R2-B(OH)2. R₁ and R₂ are aliphatic or aromatic functional groups selected independently from each other and B is a boron atom. The present invention also provides methods of synthesizing a modular fluorescence sensor and its use in labeling solid substrates.
